Can a Megalodon still exist?
The answer is quite straightforward - no. It is practically impossible for a creature of megalodon's size to still be out there,alive and flopping,without leaving any evidence for its existence. And there really is not any evidence for it,despite some of the stuff circulating online.

Are Megalodons still evaded discovery?
Yes,it is true that scientists are constantly finding new species of deep-sea creatures,and yes,it is possible that large ocean predators have still evaded discovery,but this does not mean megalodon is among them. For one thing,the shark's own physiology would make it impossible for it find enough food at the bottom of the sea to sustain it.

Where are the Marshall Islands located?
The Marshall Islands sit atop ancient submerged volcanoes rising from the ocean floor,about halfway between Hawaii and Australia,north of Nauru and Kiribati,east of the Federated States of Micronesia,and south of the disputed U.S. territory of Wake Island,to which it also lays claim.
